## **Solution Outline - Mid**

Study the role of Wikidata in enhancing the productivity of the Wikipedia writers and enhance Wikidata for Hindi and Telugu using gamification.

Name - Himanshu Maheshwari Roll No - 20171033 **Mentors -** Tushar Abhishek and Nikhil Pattiisapu

In the solution outline that was presented in version 2 of 'Problem outline and defining expected outcome', there are two sub-system in the game. The first is 'Question Creator' and the second is 'The Game'. Till now I have implemented Question Creator.

Just to recap - Question creator finds out various properties of an item whose value is missing. Now if we look at all the categories that are targeted, all of them contain things that have almost similar properties. For example Chemical Elements contains Oxygen and Argon. If we look at Wikidata entries for both of them we will see that both of them have similar properties entries. For example both of them have Atomic mass, Atomic number, Discoverer, etc. Thus if some property is missing in Argon but is there in Oxygen then that property must be there in Argon too. For example - Oxygen has property "Oxidation state", however this property is missing in Argon. Thus this system identifies such missing properties and then creates questions around them.

Entire code can be found at - <a href="https://github.com/him-mah10/social-computing-project">https://github.com/him-mah10/social-computing-project</a>

## **Approach**

The first part of the question creator downloads all the entries that belong to a particular category. For example in the case of chemical elements, it properties of all the elements. These are then stored. The entire thing is downloaded in Hindi. We first downloaded the list of all the entries that belong to a particular category. In case of chemical elements, that would be list of all chemical elements. Then we download list of all properties of each chemical elements.

द्वारा नामांकित चितर खोज की जगह GND अभिज्ञापक LCCN अभिज्ञापक उदहारण है खोजकर्ता या आविष्कारक स्रोत द्वारा वर्णित द्ख्यमान का उपवर्ग का उपवर्ग NDL पहचानकर्ता कॉमन्स शरेणी BNCF कोश फरीबेस पहचानकर्ता विषय की मुख्य श्रेणी कॉमन्स गैलरी

After that is done, we randomly select two elements and find the list of all the properties that are there in first and not in second. After this list is found we randomly select one property and create question on that property. Since the property is two or three words, we can use template method to create question. The template in case of chemical elements is: 'तत्व'+2nd element name in Hindi+ ' का '+missing property +' क्या है?. Though this method might result in

grammatically incorrect sentences, it is still comprehensible. Some questions that are generated by this methods are:

तत्व रीनियम का ख़ोज की जगह क्या है? तत्व इण्डियम का BNCF कोश क्या है? तत्व हैसियम का द्रव्यमान क्या है? तत्व पोटैशियम का फ्रीबेस पहचानकर्ता क्या है? तत्व अर्बियम का ध्विन का वेग क्या है?

Due to mids the meeting and finalization of 'Problem outline and defining expected outcome' became delayed and finalization was done on 2nd March(3 days before) and thus I was not able to do much.
